Alpert Medical School

Lifespan

Primary Care Management of the Pediatric Orthopedic Patient

Saturday, December 1, 2012

Program Description

Pediatric patients with orthopedic problems often present first to a primary care physician. Often the problem can be managed effectively without surgical intervention, thus the primary care practitioner must be familiar with the initial care of these injuries in order to initiate prompt treatment. This course will enhance attendees' familiarity with various pediatric orthopedic conditions and greatly enhance their comfort in initiaing nonoperative treatment. The curriculum will involve faculty from multiple disciplines incorporating lectures, case presentations, demonstrations as well as a splinting workshop. An oft-requested symposium on pediatric sports medicine will round out this exciting educational experience.

Educational Objectives

At the conclusion of this activity participants should be able to:

1. Manage common orthopedic conditions
2. Differentiate among the various types of sports injuries and understand the initial workup and use of higher level imaging techniques
3. Manage the initial workup of the patient with spinal deformity
4. Identify the presentation and evaluation of hip dysplasia at all ages
5. Evaluate and diagnose common pediatric upper extremity problems
6. Differentiate between normal and pathological limb rotation and alignment

Target Audience

This course is particularly relevant to medical professionals in the fields of pediatrics, family medicine, emergency medicine, chiropractic and physical therapy. The curriculum is designed for primary care physicians, advanced practice nurses, physician assistants, and nurses.

Program

7:00 - 8:00 am	**Registration and Continental Breakfast**
8:00 - 8:15	**Introduction** *Craig P. Eberson, MD*
8:15 - 8:35	**The Infant Hip (DDH)** *Jonathan Schiller, MD*
